### **Heterogeneous attention to inflation and monetary policy** (*with Ekaterina Shabalina*)

ABSTRACT: We study how heterogeneous attention to inflation affects monetary policy transmission. Using household-level surveys for the US and Australia we first show that households' attention to inflation varies with income level. We find that high-income households pay higher attention to inflation compared to other income groups. To quantify the effects for monetary policy transmission, we build a HANK model with endogenous income inequality obtained through an endogenous occupational choice where level of attention varies along the income distribution. We find that compared to fully rational inflation expectations, monetary policy faces a better inflation-output trade-off when expectations are anchored due to large indirect effects which manifest through a larger perceived fall in labor income after a monetary policy tightening. The better trade-off is achieved amid a larger decrease in welfare among low-earners.
